

# Digital Audio

The mystery behind sampling and reconstruction

Spring 2019 - Audio Tech Talk Series

January 22, 2019

What is audio?

# Analog Audio

# Digital Audio

# Sampling Theorem

# Sampling Theorem

A continuous time signal (analog) can be completely represented by its samples and can be recovered back when the sampling frequency  $\mathbf{f_s}$  is greater than or equal to the twice the highest frequency component  $\mathbf{f_m}$  of the signal. i.e.

$$\mathbf{f_s} \geq 2 * \mathbf{f_m}$$

# Examples

- Human speech (100 Hz - 4,000 Hz)
- Music (20 Hz - 20,000 Hz)
- Temperature sensor ( $\sim 0$  Hz - 0.25 Hz)

# Reconstruction

There is only ONE bandlimited signal that fits the sampled points.

# Caveats

- Sampled signal MUST be bandlimited -> **Aliasing**
- Finite bit depth (e.g. 16 bits) -> **Quantization noise**

# Pulse Code Modulation (PCM)

# Sampling Rate and Bit Depth

Bit depth = number of discrete levels -> **Dynamic range**

Sampling rate = number samples per second -> **Bandwidth**

# Sampling Rate

▶ 0:00 / 0:14 ●   ⋮

$f_s=44.1\text{ kHz} \rightarrow f_m=22.05\text{ kHz}$

▶ 0:00 / 0:14 ●   ⋮

$f_s=22.05\text{ kHz} \rightarrow f_m=11.025\text{ kHz}$

▶ 0:00 / 0:14 ●   ⋮

$f_s=11.025\text{ kHz} \rightarrow f_m=5.5125\text{ kHz}$

# Aliasing

# Anti-Aliasing Filters

▶ 0:00 / 0:03 ● — 🔊 ⋮

1 kHz + 8 kHz @ 16bit 44.1 kHz

▶ 0:00 / 0:03 ● — 🔊 ⋮

1 kHz + 8 kHz @ 16bit 11.025 kHz

▶ 0:00 / 0:03 ● — 🔊 ⋮

1 kHz + 8 kHz @ 16bit 11.025 kHz (No Anti-Aliasing filter)

▶ 0:00 / 0:14 ●  🔊 ⋮

$f_s=22.05\text{ kHz} \rightarrow f_m=11.025\text{ kHz}$

▶ 0:00 / 0:14 ● 🔊 ⋮

$f_s=22.05\text{ kHz} \rightarrow f_m=11.025\text{ kHz (no anti-aliasing filter)}$

# Bit Depth

▶ 0:00 / 0:14 ●  ⋮

16 bit -> 96 dB

▶ 0:00 / 0:14 ●  ⋮

8 bit -> 48 dB

▶ 0:00 / 0:14 ●  ⋮

Difference between 16 bit and 8 bit (with dither)

▶ 0:00 / 0:14 ●  ⋮

Difference between 16 bit and 8 bit (no dither)

# Quantization Noise

# Dither

▶ 0:00 / 0:03 ● ————— 🔊 ⋮

1 kHz sine wave @ 16 bit 44.1 kHz

▶ 0:00 / 0:03 ● ————— 🔊 ⋮

1 kHz sine wave @ 8 bit 44.1 kHz (with dither)

▶ 0:00 / 0:03 ● ————— 🔊 ⋮

1 kHz sine wave @ 8 bit 44.1 kHz (no dither)

# Analog comparison

Format	Dynamic range	Effective Bit Depth
Cassette	40 dB	6 bits
Vinyl	60 dB	10 bits
Reel-to-Reel	80 dB	13 bits
CD	96 dB	16 bits
HD Audio	144 dB	24 bits

\* These are estimates -> analog hardware performance varies

# Further Reading

- Sigma-Delta converter (PDM)
- Error-correction codes (EFM, Reed-Solomon, etc.)
- Perceptual Audio Coding (MP3, AAC, etc.)
- Relevant ECE Courses
  - ECE 3300: Signals & Systems
  - ECE 4270: Communication Systems
  - ECE 3170: Random Signal Analysis
  - ECE 4670: Digital Signal Processing

Next Talk - February 5

# Spectral Analysis

Decomposing audio with algorithms
